DATE MAILED: 12/12/2003

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

09/943,750

Applicant(s)

HOWLAND ET AL.

Examiner

Justin R Fischer

Art Unit

1733

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 01 September 2003.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-8, 12-14, 17, 19-21, 23-31, 33, 35, 36, 40-44 and 47-53 is/are pending in the application.
- 4a) Of the above claim(s) 1-8, 12-14, 17, 19-21, 23-26 and 53 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 27-31, 33, 35, 36, 40-44 and 47-52 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. §§ 119 and 120

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 13) ☒ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application) since a specific reference was included in the first sentence of the specification or in an Application Data Sheet. 37 CFR 1.78.
- a) ☐ The translation of the foreign language provisional application has been received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121 since a specific reference was included in the first sentence of the specification or in an Application Data Sheet. 37 CFR 1.78.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449) Paper No(s) 5/16/02.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

DETAILED ACTION

Election/Restrictions

1. Applicant's election without traverse of a tire anti-puncture device comprising a woven fabric (Specie II) in Paper No. 7 is acknowledged.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 27-31, 35, 36, 40-44, and 47-52 are rejected under 35 U.S.C. 103(a) as being unpatentable over McGee (US 5,785,779) and further in view of RD '421059 and Harpell (US 5,198,280). As best depicted in Figures 1 and 2, McGee teaches a tire construction comprising a tire liner 20, wherein said tire liner is formed of a puncture resistant device 46 and a plastic covering layer 45 (Column 3, Lines 45-55). McGee further teaches that the puncture resistant strip is formed of "tightly woven" fabric layers (Column 4, Lines 32-35) and while McGee fails to expressly describe the round packed factor of the fabric layers, one of ordinary skill in the art at the time of the invention would have recognized the language "tightly woven" to suggest that the fabric does not contain a large amount of interstices and thus would have a round packed factor (measure of fabric fullness) in accordance to the broad range of the claimed invention. RD '421059 has been applied to evidence the association of a "tightly woven" fabric with

Art Unit: 1733

a round packed factor or fabric tightness factor in accordance to the limitations of the claimed invention (discloses a value of greater than 0.75). Thus, it would have been obvious to form the fabric layers of McGee with a round packed factor as defined by the claimed invention, especially in view of the description of the fabric layers as "tightly woven" by McGee. As to the tenacity of the fibers, McGee suggests the use of a wide variety of fiber materials and further details a plurality of patents that describe suitable puncture resistant materials, including materials having a tenacity below 15 grams per denier. For example, Harpell is one of the noted patents in which preferred fiber materials have a tenacity of at least 10 grams per denier (Column 5, Lines 32-37). It is further noted that one of ordinary skill in the art at the time of the invention would have been able to appropriately select the fiber materials depending on the specific tire being manufactured and desired level of puncture resistance (as needed). Thus, one of ordinary skill in the art at the time of the invention would have found it obvious to select a fiber material having the claimed tenacity in the construction of the puncture resistant device of McGee.

As to claim 28, the bulk density is a measure of the mass of the fibers in relation to the volume of the fabric. Since the fabric of McGee is "tightly woven", one of ordinary skill in the art at the time of the invention would have expected the number of interstices to be extremely low and as such, the bulk density of the fabric would not be significantly different from the density of the fiber materials. It is noted that the claim requires the ratio of the bulk density to the density of the fiber materials to be at least 20 percent. Thus, one of ordinary skill in the art at the time of the invention would have readily

Art Unit: 1733

appreciated and expected the fabric of McGee to satisfy the claimed quantitative relationship.

Regarding claim 29, the covering layer 45 of McGee is specifically provided to prevent abrading between the puncture resistant layer and inner tube and as such, one of ordinary skill in the art at the time of the invention would have expected the covering layer to have the claimed abrasion limit, absent any conclusive showing of unexpected results.

With respect to claim 30, the woven fabric layers of McGee are arranged to form a "puncture resistant" strip- one of ordinary skill in the art at the time of the invention would have readily appreciated and expected the strip to provide sufficient puncture resistance and satisfy the relationship of the claimed invention. It is emphasized that this is the function of the strip, to provide puncture resistance. Furthermore, the degree of puncture resistance is a function of the number of layers and the fiber materials and would be dependent on the type of tire being manufactured.

Regarding claim 31, McGee suggests the use of an epoxy coating to enhance the puncture resistant properties of the woven fabric structure (Column 4, Lines 40-45).

As to claims 35 and 36, the discussion above regarding the description of the fabric as "tightly woven" is applicable. It is emphasized that the language "tightly woven" is generally associated with a woven fabric structure having a round packed cover factor of fabric tightness factor as defined by the claimed invention. Furthermore, since the fabric is designed to be puncture resistant, one of ordinary skill in the art at the

Art Unit: 1733

time of the invention would have expected the fabric to have a limited number of interstices (weak points of fabric wherein nails, stones could enter).

Regarding claims 40 and 41, McGee suggests a plurality of woven fabric layers to define the puncture resistant device (Column 4, Lines 32-34), wherein said layers are adjacent/bonded to one another.

As to claims 42 and 43, the strip 20 composed of a covering layer and a puncture resistant device is configured to be insertable within a tire. As depicted in Figure 1, the strip is bonded to the inner surface of the tire.

With respect to claim 44, while Harpell fails to expressly describe the inclusion of the puncture resistant device within the body of the tire, these embodiments are extremely well known in the tire industry as being equivalent alternatives. For example, RD '421059 specifically describes a similar, tightly woven fabric structure as being suitable on the inside of the tire or as a component within the body of the tire. Thus, one of ordinary skill in the art at the time of the invention would have readily appreciated the arrangement of the fabric of McGee within the tire as it represents a well known arrangement for such puncture resistant structures, it being further recognized that the tire industry recognizes the arrangement of such structures both within the tire body and within the tire cavity.

Regarding claims 47-50, as previously stated, the specific properties of the fiber materials used to form the woven fabric would be dependent on the type of tire being manufactured, the additional reinforcement present, and the amount of reinforcement needed. The claimed tenacity ranges are consistent with materials that are commonly

used in puncture resistant devices, such as polyamides (nylon) and polyesters. As stated above, these materials represent suitable fibers for the woven fabric of McGee in view of Harpell.

Regarding claim 51, while McGee fails to expressly describe the denier of the fiber materials, the claimed values are consistent with those commonly used in the tire industry. It is noted that McGee suggests a wide variety of materials, including those described by Harpell. In this instance, Harpell describes a preferred fiber denier between 10 and 400, which is extremely similar to that disclosed by the claimed invention (Column 5, Lines 50-60). One of ordinary skill in the art at the time of the invention would have been able to appropriately select the denier of the fiber material depending on the type of tire being manufactured and the necessary puncture resistance.

4. Claim 33 is rejected under 35 U.S.C. 103(a) as being unpatentable over McGee, RD '421059, and Harpell as applied in claim 27 above and further in view of Verzocchi (WO 94/12566). In describing the woven fabric structure, McGee suggests that an epoxy coating can be included to optimize the puncture resistance. While McGee fails to suggest the use of abrasive fillers or hard particles in the coating, such materials represent conventional additives that are extensively used in the tire industry when a high degree of reinforcement is desired. For example, Verzocchi (Page 2, Lines 5-9) suggests the inclusion of hard particles within a tire component and suggests that such particles reduce the onset of tears, cuts, or perforations- these benefits are analogous to those provided by the puncture resistant device of McGee. Thus, one of ordinary skill

Art Unit: 1733

in the art at the time of the invention would have found it obvious to include abrasive fillers or hard particles in the coating of McGee as they represent conventional additives in a variety of tire formulations. It is noted that while these particles are abrasive, they do not directly contact the tire due to the presence of a plastic covering layer in an analogous manner to the claimed invention.

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Clark (EP 1010554), Soderberg (US 5,365,988), Minekawa (JP 03220338), and Kusumoto (JP 10016523) are directed to pneumatic tire constructions incorporating a woven fabric reinforcing structure.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to **Justin R Fischer** whose telephone number is **(703) 605-4397** (if after December 18, 2003, (571) 272-1215). The examiner can normally be reached on M-F (7:30-4:00).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Richard Crispino can be reached on (703) 308-3853. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9310.
